TITLE:

A study of the thermal decomposition of ammonium nitrate by isotopic and mass-spectrometric method

PERIODICAL:

Zhurnal prikladnoy khimii, v. 36, no. 1, 1963, 215 - 218

TEXT:

The effects of NO_2 and HNO_3 on the initial stage in the dissociation of NH_4NO_3 at $\sim 170^\circ\text{C}$ were studied to determine the exact mechanism of this reaction. Specimens labelled with N^{15} were used, and the decomposition products and isotopic distribution were analyzed mass-spectrometrically. 100 mg samples of NH_4NO_3 were weighed into Mo glass ampoules, which were then evacuated to 10^{-5} - 10^{-7} mm Hg. N^{15}O_2 were added in amounts of $\sim 10\%$ (by weight) of the ammonium nitrate. The ampoules were then held at $173 \pm 2^\circ\text{C}$ for 20 min and the products were analyzed.

A study of the thermal ...

S/080/63/036/001/022/026
D204/D307

The interaction of NO_2 and NH_3 were also studied at 170 - 200°C. It was found that isotopic exchange took place between the gaseous NO_2 and molten NH_4NO_3 . The decomposition was accelerated by HNO_3 and strongly accelerated by NO_2 . At 170 - 180°C, when N_2O_4 may still exist, NO_2 is the main catalyst; at higher temperatures (200°C) the auto-catalysis is ascribed to HNO_3 . The mechanism of the formation of nitrogen, postulated by Rozmán (ZhPKh, 31, 7, 1101 (1958); O termicheskoy stoykosti ammiachnoy selitry [On the stability of ammonium nitrate], Leningradskiy inst. inzh. vodnogo transp. (1957)) is confirmed. There are 2 figures and 1 table.

TITLE: Mass spectrometric investigation of evaporation of the hexaborides of certain metals 2/

SOURCE: Zhurnal prikladnoy khimii, v. 39, no. 7, 1966, 1468-1470

TOPIC TAGS: vaporization, boride, cerium compound, barium compound, calcium compound, mass spectroscopy, heat of sublimation

ABSTRACT: The process of evaporation of CeB_6 , BaB_6 , and CaB_6 was studied in the 900-1700°C range under non-equilibrium conditions in vacuo and the heats of sublimation were determined. The hexaborides were vaporized by electron impact technique and the vapor compositions were monitored by the MS-4 mass spectrometer. It was found that during the heating of CeB_6 in vacuo at 1400-1900°C, two simultaneous processes occur: vaporization of CeB and its dissociation into elements. At temperatures below 1700°C, evaporation of CeB predominates while above 1700°C dissociation of CeB predominates. The dissociation energy of CeB was found to be 4.3 eV. It was found that heating of BaB_6 and CaB_6 invariably leads to their dissociation into elements which evaporate.

FOURDS: This collection of articles is intended for technical personnel concerned with the quality of surface finishes of machine parts.

COVERAGE: This collection of articles deals with problems of surface roughness and the effect of surface roughness on the wear, strength and fatigue life of machine parts. Among the topics discussed are the effect of cutting feeds and cutting-tool vibration on the surface roughness of machined parts, the effect of lay direction on the wear of plane friction surfaces, methods and instruments for measuring surface roughness, and the processing of profilograms of finished surfaces. No personalia are mentioned. References follow several of the articles.

AUTHOR: Dobychina, A.P., Candidate of Technical Sciences

TITLE: A device for quality control of the surface layer without cutting

PERIODICAL: Vestnik mashinostroyeniya, no. 4, 1961, 71-74

TEXT: The staff of the measuring laboratory of BHMN (VNII) designed a device for the above purpose based on a method proposed by Professor P.Ye. Diyachenko (Ref.: Tekhnologicheskiye faktory i kachestvo poverkhnosti. Sb. "Progressivnaya tekhnologiya mashinostroyeniya". Mashgiz, 1951) consisting in determining the difference in the speed penetration of a diamond pyramid into the machined and non-machined metal. The device records the dependence curves of penetration depth on the load and enables one to determine the values of residual and elastic deformation. A diagram showing the device and graphs of the results of some experiments are given. There are 2 tables, 4 figures and 1 Soviet-bloc reference. ↙

TITLE: Turning nonferrous alloys and glass-reinforced textolite with diamond cutters

PERIODICAL: Stanki i instrument, no. 10, 1961, 27-30

TEXT: The Vsesoyuznyy nauchno-issledovatel'skiy instrumental'nyy institut (All-Union Scientific Research Institute of Instruments) has conducted research on the external turning of nonferrous alloys and glass-reinforced textolite using diamond turning tools. The purpose of the study was to find the optimum cutting conditions and geometric shapes of the cutters, and to determine the durability, optimum wear, cutting forces, and degree and depth of workhardening caused by the cutters. The toolmaking technology was developed by NIIAlmaz. **СТ** (ST) glass-textolite, **BTZ** -1 (VTZ-1) titanium alloy, **AD** 1 (AD1) duralumin, **Бр.ОФ** 6,5-1,5 (Br. OF 6.5-1.5) bronze and **ЛС59-В1** (LS 59-V1) brass were turned on a **1М** 620 (1M620) universal thread-cutting lathe with a maximum 3000 rpm, fitted with a variable drive trans-

mission for stepless control of spindle rpm. The surface roughness of cut materials was measured with a profilometer, a profilograph, and an **MIC**-11 (MIS-11) double microscope. The investigation data are discussed and shown in graphs and tables. The optimum tool geometry, i.e. the tool tip angles, and optimum cutting parameters are given in a table (Table 2):

Material	Cutters geometry					Cutting parameters			
	φ°	φ_1°	α°	γ°	λ°	r mm	v m/min	s rpm	t mm
VTZ-1 titanium alloy	45	45	10	-5	0	1.0	300	0.03	0.03
AD1 duralumin	43	3	15	2	0	1.0	600	0.02	0.05
LS59-V1 brass	43	3	13	2	0	1.0	500	0.03	0.05
OF 6.5-1.5 bronze	45	45	15	-5	0	1.0	800	0.04	0.025
ST glass-textolite	45	45	10	-5	0	1.0	700	0.025	0.03

where v is cutting speed, s - feed in mm per revolution, t - cutting depth;

Card 2/3

S/121/61/000/010/002/005
D040/D113

Turning nonferrous alloys

γ° - back rake angle [Abstracter's note: φ° , φ_1° , α° , λ° , r - not defined]. The cutters are shown in a photograph. The following conclusions are drawn: (1) The described diamond tools may be recommended for external turning of nonferrous metals and glass-reinforced textolite on universal high-speed thread-cutting lathes with stepless rpm adjustment of the spindle in 2000-3000 rpm range and 0.01-0.1 mm/rev feed, i.e. on lathes with the same variable speed transmission as is used in the "LM62C" lathes of the zavod "Krasnyy proletariy" ("Krasnyy proletariy" Plant). Vibration in the system's machine-workpiece-cutter must not exceed 30 cycles/sec frequency and 11 μ m amplitude at maximum rpm; (2) The surface finish produced by diamond cutters is up to class 9; (3) The cutting force components in turning nonferrous metal and glass-reinforced textolite with diamond cutters are in the range of 0.15-2.0 kg-f; (4) Deformation of surface on nonferrous metals turned with diamond cutters is 5-10 μ m deep and is insignificant; (5) The durability of diamond cutters at optimum wear of 0.14-0.18 mm is 20 times higher than the durability of carbide cutters. This results in longer operational cycle without set-up and higher accuracy of work. There are 7 figures and 4 tables. X

SOV/111-59-10-13/23

AUTHOR: Dobychina, L.Ya., Deputy Chief

TITLE: Improvement of Service to the Population Is the Most Important Task of Postal Communications Workers

PERIODICAL: Vestnik svyazi, 1959, Nr 10, pp 21-23 (USSR)

ABSTRACT: This article deals very generally with a series of questions concerned with improvement of postal service in the USSR. The author treats the following subject briefly: construction and location of postal facilities and communications offices; during the seven-year plan 10,000 new fixed communications offices, and 4000 mobile ones will be opened; postal facilities isolated from settled areas, and the need to open many new communications offices in or near such areas during the seven-year plan; expansion of the network of mailboxes; in the period 1959-1965 it is intended to set up 150,000 new mailboxes; improvement of the facilities, equipment and service within post offices; accomodation of post office facilities; rudeness and red tape in postal service; in

Improvement of Service to the Population Is the Most Important Task
of Postal Communications Workers

this connection the author cites the article "What Will Communications Workers Say?" ("Sovetskaya Rossiya", 1 August 1959), and mentions M.S. Filatova, assistant to the chief of the Brusnyanka communications office in the Tula oblast'; self-service facilities in the Moscow, Minsk and other post offices for the sale of envelopes, paper, and forms, and similar facilities at the Kiyev post office for the sale of newspapers; the reception of packages, etc. at institutions, organizations and enterprises as done at the Khar'kov post office; delivery of packages to homes, and apartment house mail boxes. Also treated is the subject of improving the quality of the work of postal enterprises; the author states that the number of complaints on this score has actually risen during the first quarter of 1959. The author dwells at length on delivery of papers and correspondence, and measures for its improvement, particularly greater utilization of air and motor transport facilities. Mechanization of postal production processes, including the all

Improvement of Service to the Population Is the Most Important Task of Postal Communications Workers

around mechanization (planned) of the 50 largest post offices, is also dealt with. The author concludes with a note on the subject of postal regulations and their revision by the Glavnoye pochtovoye upravleniye ministerstva svyazi SSSR (Main Postal Administration of the Ministry of Communications of the USSR).

TITLE: Automatic and inertia-free measurement of the geometric characteristics of objects

SOURCE: Mekhanizatsiya i avtomatizatsiya proizvodstva, no. 4, 1966, 19

TOPIC TAGS: quality control, measuring instrument, industrial automation

ABSTRACT: For accurate, rapid, and objective measurements of lengths, a device has been developed in the Physics Engineering Institute im. A. O. Ioffe (fiziko-tehnicheskiy institut), a block diagram of which is shown (Fig. 1). The basic components of the instrument are: an illumination device with its supply unit, a light sensor or receiver, and a device designed to analyze and process the light signal received by the sensor. The measurement process takes place as follows: the object is positioned so that its edge or a "pennant" attached to its edge interrupts a part of the light beam from the illuminator to the sensor. The sensor is designed so as to make it possible to determine, with whatever degree of accuracy may be required, the location of the boundary of the object or of the "pennant" fastened to it. This boundary obviously

trical pulses which reach the circuit, whose function it is to count the number of illuminated fibers, i.e., to determine the size of the object. The results of this test are flashed on the display board with a test time of about 0.1 sec. The test repetition frequency is 2/sec. The unit can be adapted to provide readouts of different geometric characteristics and their

determines the length of the object, its diameter, etc. The receiver (Fig. 2) consists of a frame, fastened to which is a band with the light-guides (thin glass fibers) and a base for the photoelectric converters. Each light-guide is connected to an FO-1 photoelectric converter. The guides, 30 microns in diameter, are placed flush against each other on the band. These light ducts are faced with a layer of epoxy, and their ends are polished. The IR pulse lamp IFK is employed as the illuminator, and it is flashed during the measurement. The light strikes the open part of the fibrous light-guides, while the photocells connected to these guides give off elec-

Card 2/3

representation on tape, photographic paper, etc. The dimensions of the objects to be measured may vary within wide tolerances, with the accuracy of the measurement depending on the diameter of the light-guides used. This diameter is in turn limited by diffraction on the edges of the object. The electronic circuitry is simple and reliable in operation, and may be used for automatic rejection of off-sized items.

Card 1/1 Pub. 89 - 19/30

Authors : Dobysh, G.

Title : Zone of assured reception from the Moscow television center

Periodical : Radio 1, 40 - 42, Jan 56

Abstract : The zone around Moscow's television center within which reception may be considered as assured is discussed, a radius for this zone being set at 110 - 120 km. The possibility of reception at greater distances up to 150 - 170 km is considered, but it is explained that for this special antennas are required. The technical characteristics of various types of such antennas are described, prominent among them being the regular 4-stage antenna for distant reception and the rhomboid 4-stage antenna for distant reception. As such reception requires special amplification the technical data for designing, constructing and operating an adequate amplifier are presented. Drawings; circuit diagram.

TITLE: Conditions for undistorted reproduction of a signal at the output of a lumped-constant filter

SOURCE: Avtomatika i telemekhanika, v. 26, no. 10, 1965, 1867-1869

TOPIC TAGS: signal detection, signal distortion, information theory, filter circuit, mathematic analysis

^{16, 44, 55} ABSTRACT: The author considers a filter with transfer function

$$\Phi(s) = \frac{\sum_{i=1}^m l_i s^{i-1}}{\sum_{k=1}^r k_k s^{k-1}}$$

(1)

where $m \geq r + 1$, s is the Laplacian, k_i and l_i are the time constants of the filter parameters.

Card 1/3

UDC . 62-501.1:621.372.54.061

L 8888-66

ACC NR: AP5026970

A polynomial signal is fed to the filter input. The stationary error in signal reproduction at

$$g(t) = \sum_{i=0}^n \gamma_i t^i \tag{2}$$

the filter output is

$$e(t) = \sum_{i=0}^n \frac{C_i g^{(i)}(t)}{i!} \tag{3}$$

where

$$C_i = -\Phi^{(i)}(0),$$

$$g^{(i)}(t) = \frac{d^i g(t)}{dt^i} \tag{4}$$

and

$$N(s) = \sum_{i=0}^n l_i s^i, \quad M(s) = \sum_{i=0}^n k_i s^i \tag{5}$$

I. 8888-66

ACC NR: AP5026970

are the error factors. The problem considered is the formulation of conditions under which the output signal is equal in the steady state to the input signal, i. e. $\epsilon(t)$ should be equal to zero. If it is assumed that all Y_i in (2) are unequal to zero, and consequently $g(i)(t) \neq 0$ ($i = 0, 1, \dots, r$), then the problem reduces to finding the conditions where the error factors C_i are identical to zero. The author shows how this may be done by first deriving a general formula for calculating C_i . This general formula may be useful in various calculations of linear circuits. Only stable filters are considered in deriving a formula for undistorted reproduction conditions. Examples are given showing the possibilities for error reduction. Orig. art. has: 16 formulas.

AUTHOR: Dobzhinskiy, B.N. (Leningrad)
TITLE: Selecting the error coefficients in a special case
of the filtration problem

PERIODICAL: Avtomatika i telemekhanika, v. 24, no. 2, 1963,
280-284

TEXT: The author considers a filter with a polynomial-type signal and delta-correlated noise at its input. The filter is optimized for the minimum of the signal dispersion. It is shown that in problems in which the error coefficients are not a priori given the optimum filtering becomes simply the averaging process with a constant weighting function. If the input contains white noise with a certain autocorrelation function, the above optimum filter becomes the only optimum filter for a very wide range of signal forms: for this case the expression for the error coefficients, corresponding to the values of terms of the signal polynomial, is derived. ✓B

AUTHOR: Chizhov, A. V.; Dobzhinskiy, B. N.

TITLE: Errors in measuring variable frequency by the counting-zeros method

SOURCE: Radiotekhnika, v. 19, no. 1, 1964, 57-62

TOPIC TAGS: FM variable frequency, FM variable frequency measurement, counting zeros frequency measurement, frequency measurement error

ABSTRACT: The counting-zeros method for the accurate measurement of "instantaneous" frequency in FM circuits is theoretically considered. Two types of error are inherent in the method: (1) the error due to the nonlinear nature of frequency variation and (2) the error due to the discrete-counting device. The relation between the values of these errors and the averaging time of measurement is investigated. This formula for selecting the averaging time is recommended:

Card 1/2

ACCESSION NR: AP4014676

$$\xi(\Delta_1, \max T_m, t_{\max}) > T_a > \frac{2}{\Delta_1, \max}$$

where Δ_1 and Δ_2 are errors due to the two causes mentioned above, T_m is the FM period, t_{\max} is a moment of time corresponding to Δ_1 maximum, T_a is the averaging time, and ξ is a function $T_a = \xi(t_{\max} | \Delta_1, \max |)$. Orig. art. has: 2 figures and 20 formulas.
